

## carbon fibres type HM

Carbon fibres type HM (high modulus) are carbon fibres with a value of Young's modulus (tensile modulus) larger than 300 GPa (nearly 30% of the  $C_{11}$  elastic constant of a graphite single crystal).

Note:

The level of the tensile modulus of carbon fibres is controlled by the degree of preferred orientation of the layer planes in the direction parallel to the fibre axis.  $C_{11}$ , the elastic constant of graphite single crystals in the direction of the layer planes, is  $1060 \pm 20$  GPa. In general, the ratio of tensile strength to tensile modulus is smaller than  $1 \times 10^{-2}$  for carbon fibres type HM (but the tensile strength is influenced by flaws in the fibres and may be improved in the future). Carbon fibres type UHM (ultra-high modulus) have moduli of elasticity in excess of 600 GPa, surpassing 50% of the theoretical  $C_{11}$  number. Such high values of Young's modulus can be achieved most readily in mesophase pitch-based carbon fibres (MPP-based carbon fibres).
